

DPNR CONTENT LIBRARY

Master Architecture, Complete Catalog & Model Guide

Netflix-style discovery system + full learning content for the Human Operating System

CORE PRINCIPLE

The library teaches the language of the self. DPNR then uses what it already knows about the user to make that knowledge personal, relevant, and actionable.

Version 2.0

1. What This Library Is

DPNR is not building a traditional course catalog. The library is a living discovery layer: users can browse, learn, recognize themselves, and move into personalized exploration without needing to know psychological terminology in advance.

- Teach before interpreting. A user should understand a concept before the system applies it to their life.
- Use psychology as a lens, not a label. Patterns are hypotheses to explore, not diagnoses or fixed identities.
- Keep the first learning unit short enough to consume in 2-4 minutes.
- Show real-life examples so users can recognize a concept before being asked to reflect on it.
- End with one practical action or experiment, not a long worksheet.
- Deepen only when the user asks, or when current context makes a deeper exploration clearly useful.
- Reuse the same content object across multiple shelves, domains, and recommendations.

KEY ARCHITECTURE DECISION

Do not organize the library as one rigid tree. Build a content graph. The same topic can belong to several life domains, several psychological themes, and several recommendation shelves at the same time.

2. The Netflix-Style Experience

The user-facing experience should feel like a personalized streaming library. A user does not need to decide which psychological framework they need. They should be able to enter from what is happening in life right now.

FOR YOU Personalized topics selected from current focus, recent conversations, saved reflections, recurring patterns, and learning history.

CONTINUE EXPLORING Topics the user opened, saved, started, or discussed but did not finish.

WHAT YOU'RE NAVIGATING NOW Situation-led content such as uncertainty, conflict, burnout, distance, a big decision, loneliness, overthinking, or loss.

KNOW YOURSELF Identity, needs, values, self-worth, self-trust, beliefs, boundaries, and inner patterns.

PATTERNS WORTH NOTICING Avoidance, people-pleasing, perfectionism, control, rumination, procrastination, push-pull behavior, and other repeated loops.

RELATIONSHIPS Attachment, closeness, communication, boundaries, conflict, repair, trust, and relational safety.

EMOTIONAL WORLD Triggers, anger, shame, guilt, grief, regulation, emotional reactions, and body signals.

WORK & MONEY Ambition, success, enough, performance, money meaning, creative block, work identity, and decisions.

BODY & ENERGY Nervous-system states, fight/flight/freeze/fawn, depletion, rest, body cues, and regulation.

MEANING & LIFE Purpose, gratitude, joy, play, meaning, contribution, and integration.

START HERE Foundational topics that give new users useful language quickly: Needs, Values, Boundaries, Emotions, Patterns, Self-Trust, Attachment, Regulation.

3. Three Ways to Browse the Same Catalog

The catalog should be indexable in three parallel ways. The user can enter through any of them; the underlying content object is the same.

A. Explore by Theme

ME - Identity, self-worth, self-trust, authenticity, inner critic.

FEEL - Emotions, triggers, regulation, anger, shame, guilt, grief.

PATTERNS - Avoidance, people-pleasing, perfectionism, control, rumination, procrastination.

NEED - Needs, neediness, everyday needs, competing needs, values and internal priorities.

RELATE - Attachment styles, closeness, relational triggers, red flags, boundaries, secure relating.

REPAIR - Assertiveness, conflict, repair, forgiveness, self-compassion.

BODY - Body signals, stress states, nervous-system range, rest and depletion.

CHOOSE - Decision-making, fear vs desire, future self, values in action.

CREATE - Ambition, money, creative block, success, enough, contribution.

LIFE - Inner child, limiting beliefs, meaning, gratitude, joy, play, purpose, integration.

B. Browse by Life Domain

- Self & Identity
- Relationships & Love
- Family
- Friends & Social Connection
- Work & Career
- Money & Financial Life
- Body & Health
- Emotional Well-Being
- Personal Growth
- Leisure & Joy
- Purpose & Spiritual Meaning

Important: a psychological topic is not a life domain. Attachment can appear in love, family, friendship, and work. People-pleasing can appear across nearly every domain. The system should therefore use many-to-many tagging.

C. Browse by What Is Happening Now

- Conflict
- Uncertainty
- Feeling rejected
- Overthinking
- Feeling stuck
- Big decision
- Burnout / depletion
- Loss / letting go
- Difficulty saying no
- Relationship distance
- Fear of failure
- Need for reassurance
- Feeling unseen
- Procrastination
- Low motivation
- Creative block
- Money stress
- Identity transition

4. The DPNR Content Object

Every library topic should exist as one structured content object. This makes it usable by the UI, recommendation system, search, chat, and future personalization logic.

FIELD	USE
Topic ID	Stable internal identifier.
User Title	Short, human-facing title. Can be more inviting than the technical concept name.
Canonical Concept	The underlying concept used by the knowledge system.
Explore Theme	One primary browse theme such as FEEL or RELATE.
Life Domains	One or more domains where the concept commonly appears.
Level	Foundation / Intermediate / Deep Dive.

Content Type	Concept / Pattern / Skill / Distinction / State / Practice.
User Signals	Language or behavior that may make the topic relevant. Signals are prompts for consideration, not proof.
Related Topics	Concepts that connect naturally.
Learning Unit	Understand -> Expand the Lens -> Real Life -> Check In -> Practice -> Go Deeper.
Next Step	Journal, Main Chat, Decision Room, Mirror Room, Pull a Card, or another topic.
Safety Notes	Any cautions about diagnostic language, trauma assumptions, or severe distress.

5. Standard Learning Unit

Every user-facing topic should follow the same compact structure so the library feels coherent and predictable.

UNDERSTAND - Explain the concept in simple language. Assume the user may never have heard the term before.

EXPAND THE LENS - Teach a useful map: types, categories, distinctions, common variations, or examples. This is where Needs can introduce six broad human needs, Values can show a value bank, and Attachment can show major attachment patterns.

REAL LIFE - Give 3-5 recognizable examples across different domains. The user should be able to say, "I have seen this in my life."

CHECK IN - Ask one strong question that helps the user locate the concept in themselves.

PRACTICE - Give one small experiment, reflection, or behavioral step that can be completed immediately or within 24 hours.

GO DEEPER - If the user asks, personalize from known context instead of repeating the generic lesson.

TEACHING PRINCIPLE

The library gives language. The model creates relevance. The first view should educate; the deeper view should become personal.

6. Recommendation & Personalization Logic

The recommendation engine should behave like a thoughtful librarian, not a diagnostic classifier.

- Start from the user's current language and situation. Recommend topics that help explain what they are already experiencing.
- Prefer 2-4 strong recommendations over a long list.
- Use user signals as clues. For example, repeated checking after a delayed reply may make reassurance, uncertainty, anxious attachment, or regulation relevant - but none should be assumed as the explanation.
- Avoid repeating topics the user has already mastered unless current context makes them newly relevant.
- Mix one directly relevant topic with one adjacent topic that widens the lens.
- For new users, prioritize foundational language before deep frameworks.
- If the system has prior context, phrase personalization as an invitation: "This may connect to..." or "You may want to explore..." rather than "You are..."
- If severe distress, trauma symptoms, self-harm risk, abuse, or clinical deterioration is present, shift from self-development content to appropriate safety-oriented support.

7. Example: How One Topic Can Appear in Many Places

Canonical topic: Anxious Attachment Pattern

- Explore Theme: RELATE
- Life Domains: Relationships & Love; Family; Friends
- What You're Navigating Now: delayed reply, emotional distance, uncertainty, fear of losing someone
- Pattern Shelf: reassurance seeking, overinterpreting distance, protest behavior
- Related Topics: Needs vs. Neediness; Emotional Triggers; Self-Trust; Boundaries; Secure Relating; Regulation
- Possible user-facing titles: "When Distance Feels Like Rejection", "Why Silence Feels So Loud", "Understanding Anxious Attachment"

8. Catalog Map - 54 Core Topics

This is the starter catalog already developed for DPNR, now reorganized as a graph-ready Netflix-style library. Each topic can be surfaced in several shelves and life domains.

01. Identity vs. Roles

Theme: ME **Level:** Foundation **Type:** Distinction

Domains: Self & Identity

Useful when: role loss; identity transition; feeling useful = feeling worthy

Related: Self-Worth; Authenticity; Future Self

02. Self-Worth vs. Performance

Theme: ME **Level:** Foundation **Type:** Concept

Domains: Self; Work & Career

Useful when: criticism crash; overachievement; difficulty resting

Related: Inner Critic; Ambition; Success & Enough

03. Self-Trust

Theme: ME **Level:** Foundation **Type:** Concept

Domains: Self; Decisions

Useful when: constant advice-seeking; second-guessing; waiting for permission

Related: Decision-Making; Authenticity; Future Self

04. Authenticity

Theme: ME **Level:** Foundation **Type:** Concept

Domains: Self; Relationships; Work

Useful when: self-editing; resentment after agreeing; fear of being difficult

Related: Values; Boundaries; Self-Trust

05. Inner Critic

Theme: ME **Level:** Foundation **Type:** Concept

Domains: Self; Work; Emotional Well-Being

Useful when: harsh self-talk; perfectionistic standards; replaying mistakes

Related: Self-Compassion; Perfectionism; Shame vs. Guilt

06. Emotion vs. Reaction

Theme: FEEL **Level:** Foundation **Type:** Concept / Skill

Domains: Emotional Well-Being; Relationships

Useful when: impulsive texting; shutting down; acting from anger or fear

Related: Emotional Regulation; Triggers; Body Signals

07. Emotional Triggers

Theme: FEEL **Level:** Foundation **Type:** Concept / Skill

Domains: All domains

Useful when: strong reactions; old meanings; disproportionate intensity

Related: Emotion vs. Reaction; Body Signals; Attachment

08. Emotional Regulation

Theme: FEEL **Level:** Foundation **Type:** Concept / Skill

Domains: Emotional Well-Being; Body

Useful when: overwhelm; inability to think in conflict; chronic distraction

Related: Window of Tolerance; Body Signals; Rest

09. Anger

Theme: FEEL **Level:** Foundation **Type:** Concept / Skill

Domains: Relationships; Family; Work

Useful when: resentment; irritability; perceived unfairness

Related: Boundaries; Emotional Regulation; Conflict & Repair

10. Shame vs. Guilt

Theme: FEEL **Level:** Intermediate **Type:** Concept / Skill

Domains: Self; Relationships

Useful when: identity-level self-attack; hiding; repair avoidance

Related: Self-Compassion; Forgiveness; Inner Critic

11. Grief & Letting Go

Theme: FEEL **Level:** Foundation **Type:** Concept / Skill

Domains: Relationships; Family; Life transitions

Useful when: loss; ending; unrealized future; identity shift

Related: Forgiveness; Meaning; Integration

12. Avoidance

Theme: PATTERNS **Level:** Foundation **Type:** Pattern

Domains: All domains

Useful when: delayed conversations; escape; not opening tasks/messages

Related: Procrastination; Fear vs. Desire; Emotional Regulation

13. People-Pleasing

Theme: PATTERNS **Level:** Foundation **Type:** Pattern

Domains: Relationships; Family; Work

Useful when: automatic yes; guilt saying no; resentment

Related: Boundaries; Needs; Assertiveness

14. Perfectionism

Theme: PATTERNS **Level:** Foundation **Type:** Pattern

Domains: Work; Self; Growth

Useful when: overpreparing; difficulty finishing; impossible standards

Related: Inner Critic; Procrastination; Self-Worth

15. Control

Theme: PATTERNS **Level:** Foundation **Type:** Pattern

Domains: Relationships; Work; Family

Useful when: micromanaging; intolerance of uncertainty; forcing outcomes

Related: Self-Trust; Decision-Making; Regulation

16. Overthinking & Rumination

Theme: PATTERNS **Level:** Foundation **Type:** Pattern

Domains: Self; Work; Relationships

Useful when: replaying; endless analysis; no new information

Related: Decision-Making; Regulation; Control

17. Procrastination

Theme: PATTERNS **Level:** Foundation **Type:** Pattern

Domains: Work; Growth; Self

Useful when: delaying despite cost; task dread; vague overwhelm

Related: Avoidance; Perfectionism; Decision-Making

18. Needs vs. Neediness

Theme: NEED **Level:** Foundation **Type:** Concept / Distinction

Domains: Relationships; Self

Useful when: shame about needing; overdependence on one outcome/person

Related: Six Broad Human Needs; Boundaries; Attachment

19. Six Broad Human Needs

Theme: NEED **Level:** Foundation **Type:** Concept / Distinction

Domains: All domains

Useful when: repeated drives around certainty, variety, significance, connection, growth, contribution

Related: Basic Needs; Values; Competing Needs

20. Basic Everyday Needs

Theme: NEED **Level:** Foundation **Type:** Concept / Distinction

Domains: Body; Emotional Well-Being

Useful when: irritability; depletion; overstimulation; lack of rest/space

Related: Rest & Depletion; Body Signals; Regulation

21. Competing Needs

Theme: NEED **Level:** Foundation **Type:** Concept / Distinction

Domains: All domains

Useful when: feeling torn; security vs growth; closeness vs autonomy

Related: Decision-Making; Values; Needs vs. Neediness

22. Values

Theme: NEED **Level:** Foundation **Type:** Concept / Distinction

Domains: All domains

Useful when: unclear priorities; feeling misaligned; decisions that look right but feel wrong

Related: Values vs. Rules; Value Conflicts; Decision-Making

23. Values vs. Rules

Theme: NEED **Level:** Intermediate **Type:** Concept / Distinction

Domains: Self; Family; Work

Useful when: living by inherited shoulds; guilt; rigid standards

Related: Values; Authenticity; Limiting Beliefs

24. Value Conflicts

Theme: NEED **Level:** Intermediate **Type:** Concept / Distinction

Domains: All domains

Useful when: two important truths pulling in opposite directions

Related: Competing Needs; Decision-Making; Boundaries

25. Attachment Styles - Overview

Theme: RELATE **Level:** Foundation **Type:** Concept / Pattern

Domains: Relationships; Family; Friends

Useful when: curiosity about closeness patterns; repeated relationship loops

Related: Anxious; Avoidant; Fearful-Avoidant; Secure Relating

26. Anxious Attachment Pattern

Theme: RELATE **Level:** Intermediate **Type:** Concept / Pattern

Domains: Relationships; Family; Friends

Useful when: reassurance seeking; fear of distance; hypervigilance to cues

Related: Needs vs. Neediness; Triggers; Secure Relating

27. Avoidant Attachment Pattern

Theme: RELATE **Level:** Intermediate **Type:** Concept / Pattern

Domains: Relationships; Family; Friends

Useful when: pulling away under closeness; self-reliance; discomfort with needs

Related: Boundaries; Vulnerability; Secure Relating

28. Fearful-Avoidant / Push-Pull Pattern

Theme: RELATE **Level:** Intermediate **Type:** Concept / Pattern

Domains: Relationships

Useful when: wanting closeness and fearing it; alternating pursuit and distance

Related: Triggers; Regulation; Secure Relating

29. Secure Relating

Theme: RELATE **Level:** Foundation **Type:** Concept / Pattern

Domains: Relationships; Family; Friends

Useful when: interest in healthier connection; repair; direct needs

Related: Boundaries; Assertiveness; Conflict & Repair

30. Relationship Red Flags vs. Triggers

Theme: RELATE **Level:** Foundation **Type:** Concept / Pattern

Domains: Relationships

Useful when: confusion between internal activation and genuinely unsafe/unhealthy behavior

Related: Triggers; Boundaries; Secure Relating

31. Boundaries

Theme: RELATE **Level:** Foundation **Type:** Concept / Pattern

Domains: Relationships; Family; Work; Time

Useful when: resentment; overgiving; saying yes while feeling no

Related: Assertiveness; Values; People-Pleasing

32. Boundary vs. Ultimatum

Theme: RELATE **Level:** Intermediate **Type:** Concept / Pattern

Domains: Relationships; Family; Work

Useful when: threatening to control others; confusing limits with demands

Related: Boundaries; Assertiveness; Conflict & Repair

33. Assertiveness

Theme: REPAIR **Level:** Foundation **Type:** Skill / Practice

Domains: Relationships; Work; Family

Useful when: difficulty asking; aggression/passivity swings; overexplaining

Related: Boundaries; Conflict & Repair; Self-Trust

34. Conflict & Repair

Theme: REPAIR **Level:** Foundation **Type:** Skill / Practice

Domains: Relationships; Family; Work

Useful when: recurring fights; rupture without repair; defensive cycles

Related: Assertiveness; Regulation; Secure Relating

35. Body Signals

Theme: BODY **Level:** Foundation **Type:** State / Skill

Domains: Body; Emotional Well-Being

Useful when: tension; shutdown; restlessness; somatic yes/no cues

Related: Regulation; Window of Tolerance; Triggers

36. Fight, Flight, Freeze & Fawn

Theme: BODY **Level:** Foundation **Type:** State / Skill

Domains: Body; Relationships; Work

Useful when: stress reactions; appeasing; fleeing; freezing; escalating

Related: Body Signals; Regulation; Window of Tolerance

37. Window of Tolerance

Theme: BODY **Level:** Intermediate **Type:** State / Skill

Domains: Body; Emotional Well-Being

Useful when: too activated or shut down to think clearly

Related: Regulation; Rest; Fight/Flight/Freeze/Fawn

38. Rest, Recovery & Depletion

Theme: BODY **Level:** Foundation **Type:** State / Skill

Domains: Body; Work; Life

Useful when: exhaustion; irritability; overwork; inability to recover

Related: Basic Needs; Ambition; Regulation

39. Decision-Making

Theme: CHOOSE **Level:** Foundation **Type:** Skill / Distinction

Domains: All domains

Useful when: stuck between options; advice overload; repeated reconsidering

Related: Values; Competing Needs; Self-Trust

40. Fear vs. Desire in Decisions

Theme: CHOOSE **Level:** Foundation **Type:** Skill / Distinction

Domains: All domains

Useful when: choosing mainly to avoid fear; difficulty hearing desire

Related: Decision-Making; Future Self; Values

41. Future Self

Theme: CHOOSE **Level:** Foundation **Type:** Skill / Distinction

Domains: Self; Growth; Work

Useful when: short-term comfort vs long-term direction; identity transition

Related: Decision-Making; Purpose; Ambition

42. Ambition

Theme: CREATE **Level:** Foundation **Type:** Concept / Reflection

Domains: Work; Career; Self

Useful when: drive; achievement; pressure; identity fused with success

Related: Self-Worth; Success & Enough; Rest

43. Money Meaning

Theme: CREATE **Level:** Foundation **Type:** Concept / Reflection

Domains: Money; Self; Family

Useful when: security fears; status; guilt; scarcity; freedom

Related: Needs; Values; Success & Enough

44. Creative Block

Theme: CREATE **Level:** Foundation **Type:** Concept / Reflection

Domains: Work; Growth; Leisure

Useful when: stuck creation; fear of judgment; perfectionistic delay

Related: Perfectionism; Inner Critic; Joy & Play

45. Success & Enough

Theme: CREATE **Level:** Foundation **Type:** Concept / Reflection

Domains: Work; Money; Self

Useful when: moving goalposts; never enough; achievement without satisfaction

Related: Ambition; Self-Worth; Meaning

46. Inner Child - A Practical Lens

Theme: LIFE **Level:** Intermediate **Type:** Concept / Reflection

Domains: Self; Family; Relationships

Useful when: younger emotional reactions; unmet developmental needs; old coping

Related: Triggers; Attachment; Self-Compassion

47. Limiting Beliefs

Theme: LIFE **Level:** Foundation **Type:** Concept / Reflection

Domains: All domains

Useful when: rigid “I can’t / people always / I must” conclusions

Related: Values vs. Rules; Inner Critic; Future Self

48. Forgiveness

Theme: REPAIR **Level:** Intermediate **Type:** Skill / Practice

Domains: Self; Relationships; Family

Useful when: stuck blame; self-punishment; desire to release without excusing

Related: Shame vs. Guilt; Grief; Self-Compassion

49. Self-Compassion

Theme: REPAIR **Level:** Foundation **Type:** Skill / Practice

Domains: Self; Emotional Well-Being

Useful when: harshness under failure; shame; low tolerance for imperfection

Related: Inner Critic; Shame vs. Guilt; Forgiveness

50. Meaning vs. Happiness

Theme: LIFE **Level:** Foundation **Type:** Concept / Reflection

Domains: Purpose; Emotional Well-Being

Useful when: chasing constant good feelings; questioning what makes life worthwhile

Related: Purpose; Gratitude; Integration

51. Gratitude

Theme: LIFE **Level:** Foundation **Type:** Concept / Reflection

Domains: All domains

Useful when: attention stuck on lack; difficulty noticing what is working

Related: Joy & Play; Meaning; Integration

52. Joy & Play

Theme: LIFE **Level:** Foundation **Type:** Concept / Reflection

Domains: Leisure; Relationships; Self

Useful when: life feeling over-serious; low spontaneity; pleasure guilt

Related: Rest; Gratitude; Creative Block

53. Purpose

Theme: LIFE **Level:** Foundation **Type:** Concept / Reflection

Domains: Work; Growth; Meaning

Useful when: direction questions; contribution; “why am I doing this?”

Related: Meaning; Future Self; Values

54. Integration

Theme: LIFE **Level:** Deep Dive **Type:** Concept / Reflection

Domains: All domains

Useful when: many insights but little behavioral change; fragmented learning

Related: Future Self; Practice; Growth tracking

9. Worked Topic Example - How a Learning Unit Should Feel

This example shows the expected user-facing depth. Other topics should use the same pattern and remain concise enough to consume in one sitting.

NEEDS - What Is Underneath What You Want?

UNDERSTAND

A need is something your inner system is trying to receive, protect, create, or experience. We often focus on the surface - “I need them to text me back,” “I need this job,” “I need my partner to change” - but underneath the specific outcome there is often a deeper human need. Recognizing the need underneath the reaction helps you understand why something matters and gives you more than one way to respond to it.

EXPAND THE LENS

One useful map is six broad human needs:

CERTAINTY - Safety, stability, predictability, comfort, knowing what to expect.

VARIETY - Change, stimulation, novelty, surprise, movement, challenge.

SIGNIFICANCE - Feeling seen, valued, important, respected, or meaningful.

LOVE & CONNECTION - Closeness, belonging, intimacy, affection, friendship, being understood.

GROWTH - Learning, evolving, expanding, developing new capacities.

CONTRIBUTION - Giving beyond yourself, helping, creating value, caring, participating in something meaningful.

Everyday needs can also include rest, space, autonomy, support, recognition, affection, respect, belonging, play, freedom, reassurance, clarity, security, expression, and meaning.

IMPORTANT DISTINCTION

The behavior is not the need. Checking your phone is a behavior; reassurance may be the need underneath it. Overworking is a behavior; significance, security, or recognition may be underneath it. Avoiding a conversation is a behavior; safety or belonging may be underneath it.

REAL LIFE

- “I am angry they did not call.” The deeper need may be connection, consideration, or reassurance.
- “I keep checking whether they replied.” The underlying need may be certainty.
- “Everything is fine but I feel restless.” Variety, stimulation, or growth may be underfed.
- “I keep saying yes when I want to say no.” Belonging or approval may be overriding autonomy.
- “I achieved something big and it still does not feel enough.” Significance may be tied too tightly to achievement.
- “I want to leave my job but I am scared.” Security and growth may both be valid and in conflict.

NEED VS. NEEDINESS

Having needs is human. Neediness is not “having too many needs.” It is better understood as becoming overly dependent on one person, one response, or one specific outcome to regulate, validate, or stabilize the self. The goal is not to eliminate the need; it is to recognize it clearly and widen the number of healthy ways it can be met.

CHECK IN

Think of something taking up emotional space lately. What do you keep wanting from the situation - and what deeper need might be underneath it?

PRACTICE

Complete four lines: What happened? What did I feel or do? What did I want? The need underneath may be _____. Then ask: Is there another healthy way I could care for this need without depending entirely on this one person, outcome, or situation?

GO DEEPER WITH DPNR

- Help me understand which needs are strongest for me.
- Show me how this need appears in my relationships or work.
- Could two of my needs be in conflict?
- What patterns have you noticed around this need?
- Help me find a healthier way to meet it.

10. Rules for Creating New Library Content

- One concept per unit. Do not combine several theories into one lesson unless the lesson is explicitly a comparison.
- Teach first. Personalize second.
- Include one meaningful distinction whenever it reduces confusion: need vs neediness, guilt vs shame, boundary vs ultimatum, emotion vs reaction, trigger vs red flag, value vs rule.
- Give 3-5 everyday examples across different domains.
- Use only one core check-in question in the base unit.
- Give one small practice that can be completed now or within 24 hours.
- Avoid deterministic causal claims. “May be connected to” is better than “This comes from.”
- Do not diagnose attachment disorders, personality disorders, trauma, or mental illness from ordinary behavior.
- Preserve accountability. Understanding a protective pattern should increase choice, not excuse harmful behavior.
- When the user asks to go deeper, use known context and ask fewer, better questions rather than repeating theory.
- Allow the same topic to have several user-facing titles depending on context, while keeping one canonical internal topic.

11. Product & Model Implementation Notes

For the MVP, the catalog does not need hundreds of lessons. It needs a strong starter set with clear metadata, recommendation logic, and a consistent learning template. The 54 topics in this guide are sufficient to create a meaningful first library while leaving room to expand later.

- Store topics as structured records, not static PDF pages.
- Allow many-to-many links between topics, domains, user signals, and shelves.
- Track opened, completed, saved, discussed, and revisited topics.
- Use recommendation explanations internally, but keep the user-facing rationale light and non-invasive.
- Support multiple entry points: browse, search, recommendation, chat deep-link, Pull a Card, Decision Room, Mirror Room.
- Keep “For You” dynamic. It should change as the user’s current focus changes.
- Use a clear fallback for users with little data: Start Here + popular foundational topics + self-selected domains.

MVP GOAL

A user should be able to enter the library with no psychological vocabulary, learn one useful concept in a few minutes, recognize it in real life, try one small practice, and optionally continue into a personalized DPNR conversation.

DPNR Content Library - Architecture, Catalog & Model Guide

PART II - COMPLETE LIBRARY CONTENT

The following section contains the full starter learning library. Each topic is written as a reusable content object and follows one consistent learning flow: UNDERSTAND, EXPAND THE LENS, HOW IT MAY LOOK IN REAL LIFE, CHECK IN, PRACTICE, and GO DEEPER WITH DPNR. The same topic can be surfaced across multiple shelves and Life Domains according to context and personalization logic defined in Part I.

1. SELF - Identity, Worth & Inner Position

These topics help users separate who they are from roles, performance, approval, and old stories. The goal is not to create a fixed identity, but to build a more conscious relationship with the self.

Identity vs. Roles

UNDERSTAND

Identity is your evolving sense of who you are. Roles are the positions you hold - parent, partner, founder, employee, child, caregiver, friend. Roles matter, but they are not the whole self.

EXPAND THE LENS

A person can become over-identified with one role. When that role changes, they may feel lost. A healthier identity can hold multiple roles while preserving a sense of self underneath them.

HOW IT MAY LOOK IN REAL LIFE

- You feel valuable mainly when you are useful to others.
- A work setback makes you question who you are, not only what happened.
- You struggle to answer who you are without listing roles or achievements.

CHECK IN

Who are you when no role needs to be performed?

PRACTICE

Write three sentences beginning with: "I am someone who..." without naming a role, title, relationship, or achievement.

GO DEEPER WITH DPNR

Explore which roles currently carry too much of the user's identity and what qualities remain stable across contexts.

Self-Worth vs. Performance

UNDERSTAND

Self-worth is the sense that you have value as a person. Performance is what you do and how well you do it. They influence each other, but they are not the same thing.

EXPAND THE LENS

When worth becomes fused with achievement, praise, money, beauty, productivity, or being needed, every setback can feel personal. Healthy ambition does not require turning every outcome into a verdict on the self.

HOW IT MAY LOOK IN REAL LIFE

- A small mistake feels like proof that you are not good enough.
- You relax only after you have “earned” it.
- Praise gives a high, criticism creates a crash.

CHECK IN

Where do you most often turn an outcome into a judgment about yourself?

PRACTICE

Choose one recent outcome. Separate it into two columns: “What happened” and “What I made it mean about me.”

GO DEEPER WITH DPNR

Help the user identify domains where worth is conditional and distinguish useful feedback from identity-level conclusions.

Self-Trust

UNDERSTAND

Self-trust is confidence that you can listen to yourself, make decisions, respond to consequences, and repair when needed. It is not the belief that you will always be right.

EXPAND THE LENS

Self-trust grows through evidence: noticing your signals, making choices, keeping small promises, learning from mistakes, and recovering after uncertainty.

HOW IT MAY LOOK IN REAL LIFE

- You ask many people for advice but feel more confused afterward.
- You know what you want but keep looking for permission.
- You distrust your reaction because you have been wrong before.

CHECK IN

Where do you already know more than you are allowing yourself to trust?

PRACTICE

Make one small decision today without polling anyone else. Notice what made it easier or harder.

GO DEEPER WITH DPNR

Explore whether the user needs more information, more time, or simply more permission to trust an already clear preference.

Authenticity

UNDERSTAND

Authenticity is the ability to act in ways that feel congruent with your values, feelings, needs, and reality. It does not mean saying everything to everyone or never adapting socially.

EXPAND THE LENS

Authenticity requires both self-awareness and discernment. Privacy is not inauthenticity. Flexibility is not self-betrayal. The question is whether adaptation costs you your core truth.

HOW IT MAY LOOK IN REAL LIFE

- You become a different version of yourself around certain people.
- You say what is expected and feel resentful later.
- You hide preferences because you fear being difficult.

CHECK IN

Where in your life do you feel most edited?

PRACTICE

Choose one small preference you normally suppress and express it clearly this week.

GO DEEPER WITH DPNR

Help distinguish healthy social flexibility from chronic self-silencing.

Inner Critic

UNDERSTAND

The inner critic is the internal voice that monitors, judges, warns, compares, or pushes. It often tries to protect against failure, rejection, shame, or loss of control, even when its tone becomes harsh.

EXPAND THE LENS

Useful self-evaluation is specific and actionable. The inner critic tends to be global: “You always fail,” “You are too much,” “You should know better.” The goal is not to eliminate it, but to relate to it differently.

HOW IT MAY LOOK IN REAL LIFE

- You replay mistakes long after they are useful to review.
- Your standards rise every time you meet them.
- You speak to yourself in ways you would never speak to someone you love.

CHECK IN

What is your inner critic trying to prevent?

PRACTICE

Rewrite one critical sentence as specific information: from “I am a failure” to “I am disappointed with how I handled X, and I want to change Y.”

GO DEEPER WITH DPNR

Identify triggers, protective intent, and a more effective internal response without romanticizing the critic.

2. FEEL - Emotions & Regulation

The aim is emotional literacy: helping users notice, name, tolerate, understand, and respond to emotions without treating them as commands or problems to eliminate.

Emotion vs. Reaction

UNDERSTAND

An emotion is an internal experience. A reaction is what you do next. Anger is not shouting. Fear is not avoidance. Sadness is not withdrawal. Separating feeling from behavior creates choice.

EXPAND THE LENS

Emotions carry information, but they are not always instructions. A feeling can be valid even when the first impulse it creates is not useful.

HOW IT MAY LOOK IN REAL LIFE

- You feel rejected and immediately send multiple messages.
- You feel anxious and cancel something important.
- You feel angry and decide the other person must be wrong.

CHECK IN

What are you feeling, and what are you doing because of that feeling?

PRACTICE

Name the feeling. Then wait ten minutes before acting on the first impulse. Ask: “What response would still make sense tomorrow?”

GO DEEPER WITH DPNR

Help the user separate emotion, interpretation, impulse, and chosen behavior.

Emotional Triggers

UNDERSTAND

A trigger is something that activates a stronger emotional response than the present event alone seems to explain. Triggers can connect to past experiences, expectations, values, fears, or unresolved meanings.

EXPAND THE LENS

Not every strong reaction is trauma. Sometimes the present situation really matters. The useful question is whether the intensity belongs entirely to now or whether older learning is adding volume.

HOW IT MAY LOOK IN REAL LIFE

- A delayed reply feels like abandonment.
- A colleague's tone creates a disproportionate sense of humiliation.
- A small change of plan creates intense anxiety.

CHECK IN

What happened - and what did your system immediately believe it meant?

PRACTICE

Write: event -> meaning -> feeling -> impulse. Then add one alternative meaning that is also plausible.

GO DEEPER WITH DPNR

Explore repeated trigger themes, especially rejection, criticism, uncertainty, control, exclusion, and disappointment.

Emotional Regulation

UNDERSTAND

Emotional regulation is the ability to stay in contact with an emotion while helping the nervous system return to a workable range. It is not suppression, positivity, or never becoming overwhelmed.

EXPAND THE LENS

Regulation can involve breath, movement, naming, time, sensory grounding, co-regulation, boundaries, sleep, food, or simply reducing stimulation. Different states need different tools.

HOW IT MAY LOOK IN REAL LIFE

- You cannot think clearly during conflict.
- You try to reason with yourself while your body is highly activated.
- You use distraction for every uncomfortable emotion.

CHECK IN

What does your body need before your mind can solve this?

PRACTICE

Choose one regulation tool: slower exhale, short walk, cold water on hands, quiet, stretching, or contacting a safe person. Reassess after five minutes.

GO DEEPER WITH DPNR

Match regulation tools to the user's actual state instead of giving generic calming advice.

Anger

UNDERSTAND

Anger often appears when something feels unfair, threatening, blocked, intrusive, or disrespectful. It can protect boundaries and mobilize action.

EXPAND THE LENS

Anger may sit on top of hurt, fear, shame, helplessness, or exhaustion - but not always. Sometimes anger is simply anger. The task is to understand what it is protecting and how to express it responsibly.

HOW IT MAY LOOK IN REAL LIFE

- You become angry after repeatedly saying yes when you meant no.
- You feel rage when you are not taken seriously.
- You stay “calm” for weeks and then explode.

CHECK IN

What does your anger want protected, changed, or acknowledged?

PRACTICE

Complete: “I am angry because _____. What matters to me here is _____.”

GO DEEPER WITH DPNR

Explore boundary violations, unmet expectations, accumulated resentment, and constructive expression.

Shame vs. Guilt

UNDERSTAND

Guilt says: “I did something I regret.” Shame says: “There is something wrong with me.” Guilt can guide repair. Shame often pushes hiding, collapse, defensiveness, or self-attack.

EXPAND THE LENS

Healthy responsibility does not require identity-level condemnation. A person can face harm honestly while preserving the possibility of learning and repair.

HOW IT MAY LOOK IN REAL LIFE

- You avoid apologizing because admitting the mistake feels unbearable.
- You keep punishing yourself long after you have taken responsibility.
- Criticism makes you want to disappear rather than improve.

CHECK IN

Are you judging what you did, or who you are?

PRACTICE

Write one sentence of responsibility and one sentence of humanity: “I regret _____. I am still a person capable of repair.”

GO DEEPER WITH DPNR

Help separate accountability from self-erasure and identify whether shame is blocking repair.

Grief & Letting Go

UNDERSTAND

Grief is the process of adapting to loss. The loss may be a person, relationship, identity, dream, role, future, or version of life that will not happen as imagined.

EXPAND THE LENS

Letting go is not forgetting, approving, or no longer caring. It is gradually reducing the demand that reality be different from what it is.

HOW IT MAY LOOK IN REAL LIFE

- You miss not only the person but the future you imagined.
- A career change feels like losing part of your identity.
- You keep revisiting the same “what if” because the ending feels unfinished.

CHECK IN

What exactly are you grieving - the reality, the person, the role, or the future you imagined?

PRACTICE

Name the loss in one sentence and the part of life that still remains available to you.

GO DEEPER WITH DPNR

Explore ambiguous loss, identity loss, unfinished meaning, and the difference between remembering and remaining stuck.

3. PATTERNS - Automatic Loops & Protective Strategies

These topics help users recognize repeated loops without reducing them to labels. Patterns are learned strategies, not fixed identities.

Avoidance

UNDERSTAND

Avoidance is moving away from discomfort, uncertainty, conflict, emotion, or effort. It can be protective in the short term and costly when it repeatedly blocks important action.

EXPAND THE LENS

Avoidance can look active: overworking, joking, scrolling, helping others, planning endlessly, staying busy, intellectualizing, or changing the subject.

HOW IT MAY LOOK IN REAL LIFE

- You delay a conversation even though the tension keeps growing.
- You research for weeks instead of deciding.
- You keep busy so you do not have to feel.

CHECK IN

What discomfort are you trying not to experience?

PRACTICE

Choose the smallest version of the avoided action and do it for five minutes.

GO DEEPER WITH DPNR

Distinguish healthy pacing from chronic avoidance; identify the feared feeling or outcome underneath.

People-Pleasing

UNDERSTAND

People-pleasing is prioritizing approval, harmony, or others' comfort so strongly that your own truth becomes secondary. Kindness and generosity are not the same as people-pleasing.

EXPAND THE LENS

The clue is often the cost: resentment, exhaustion, self-silencing, or saying yes from fear rather than choice.

HOW IT MAY LOOK IN REAL LIFE

- You agree quickly and regret it later.
- You scan the room for how everyone feels before checking yourself.
- You soften every boundary so no one can be disappointed.

CHECK IN

If you knew no one would be upset, what would you choose?

PRACTICE

Before your next yes, pause and ask: “Would I still choose this if approval were guaranteed either way?”

GO DEEPER WITH DPNR

Explore fear of rejection, conflict, disapproval, or being seen as selfish.

Perfectionism

UNDERSTAND

Perfectionism is not simply high standards. It is when mistakes, uncertainty, or “good enough” feel threatening to identity, safety, belonging, or control.

EXPAND THE LENS

It can create procrastination, overwork, rigidity, difficulty delegating, chronic dissatisfaction, or never finishing.

HOW IT MAY LOOK IN REAL LIFE

- You delay sharing work until it is flawless.
- You achieve something and immediately focus on what could be better.
- You avoid trying because you may not excel.

CHECK IN

What do you believe a mistake would say about you?

PRACTICE

Define a “good enough” version before starting. Stop when you reach it.

GO DEEPER WITH DPNR

Explore whether perfectionism protects from criticism, shame, uncertainty, or loss of control.

Control

UNDERSTAND

Control is the effort to reduce uncertainty by managing outcomes, people, information, or timing. Some control is useful; over-control can create rigidity and anxiety.

EXPAND THE LENS

The opposite of control is not passivity. It is distinguishing what is yours to influence from what is not yours to command.

HOW IT MAY LOOK IN REAL LIFE

- You struggle when plans change unexpectedly.

- You repeat instructions because trusting others feels risky.
- You feel responsible for preventing everyone's disappointment.

CHECK IN

What are you trying to guarantee that cannot actually be guaranteed?

PRACTICE

Make two lists: "I can influence" and "I cannot control." Put today's concern in the correct column.

GO DEEPER WITH DPNR

Help the user identify useful action versus attempts to eliminate uncertainty.

Overthinking & Rumination

UNDERSTAND

Overthinking is repeated mental processing that feels productive but often does not create new information or action. Rumination is repetitive thinking around distress, mistakes, or unresolved meaning.

EXPAND THE LENS

The key distinction is movement. Reflection clarifies. Rumination circles.

HOW IT MAY LOOK IN REAL LIFE

- You replay a conversation looking for the perfect interpretation.
- You keep asking the same question in different forms.
- Thinking increases anxiety but not clarity.

CHECK IN

Has this thinking produced any new information in the last ten minutes?

PRACTICE

Write the question once. Under it, write either the next action or "no action available yet." Then stop processing for a set period.

GO DEEPER WITH DPNR

Identify whether the user needs data, action, acceptance, or regulation - not more analysis.

Procrastination

UNDERSTAND

Procrastination is delaying an intended action even when delay creates cost. It is often less about laziness and more about emotion, ambiguity, overwhelm, perfectionism, low reward, or fear of evaluation.

EXPAND THE LENS

Different causes need different solutions. A vague task needs clarity. An overwhelming task needs reduction. A feared task may need emotional support. A meaningless task may need motivation or redesign.

HOW IT MAY LOOK IN REAL LIFE

- You do small tasks to avoid the important one.
- You wait for the “right mood” to begin.
- You repeatedly underestimate how emotionally hard the task feels.

CHECK IN

What feeling appears when you imagine starting?

PRACTICE

Reduce the task to a two-minute entry step and begin before negotiating with yourself.

GO DEEPER WITH DPNR

Classify the likely driver: ambiguity, perfectionism, fear, boredom, low energy, resentment, or overload.

4. NEEDS - Human Needs, Neediness & Motivation

The system should teach needs as normal human drivers, while distinguishing healthy needs from rigid dependency on one person or one outcome.

Needs vs. Neediness

UNDERSTAND

A need is a legitimate human requirement or inner drive - such as safety, connection, autonomy, rest, meaning, recognition, or growth. Neediness is not “having needs.” It is when a need becomes fused with urgency, fear, or the belief that only one specific person or outcome can regulate your sense of safety or worth.

EXPAND THE LENS

The distinction is flexibility. A healthy need can be named, negotiated, and met in more than one way. Neediness often sounds like: “I need this exact response now or I cannot be okay.” The goal is not independence from others; healthy humans are interdependent.

HOW IT MAY LOOK IN REAL LIFE

- Need: “I need reassurance after a hard conversation.” Neediness: “If they do not reassure me immediately, it means I am unlovable.”
- Need: “I need closeness.” Neediness: “Only this person can make me feel whole.”
- Need: “I need recognition at work.” Neediness: “If my manager does not praise me, my work has no value.”

CHECK IN

What is the real need - and have you attached it to only one possible source?

PRACTICE

Name the need, then list three different ways it could be supported: by you, by another person, and by your environment or routine.

GO DEEPER WITH DPNR

Help the user normalize the need while widening the range of ways it can be met.

Six Broad Human Needs

UNDERSTAND

One useful map groups human motivation into six broad needs: certainty, variety, significance, love/connection, growth, and contribution. This is not the only valid model, but it is a practical lens for noticing what drives behavior.

EXPAND THE LENS

CERTAINTY: safety, stability, predictability. VARIETY: novelty, movement, stimulation.

SIGNIFICANCE: feeling valued, unique, important. LOVE/CONNECTION: belonging, closeness,

intimacy. GROWTH: learning and expanding. CONTRIBUTION: giving beyond the self and creating value.

HOW IT MAY LOOK IN REAL LIFE

- A person may stay in an unfulfilling job because certainty is currently stronger than growth.
- Someone may create constant drama because variety feels more tolerable than calm.
- Achievement may meet significance but leave connection underfed.

CHECK IN

Which two needs seem strongest in your life right now?

PRACTICE

Choose one recent decision and ask which need it served most strongly. Then ask which need may have been neglected.

GO DEEPER WITH DPNR

Explore conflicts between needs and whether the current strategy for meeting a need is healthy, costly, or outdated.

Basic Everyday Needs

UNDERSTAND

Beyond broad motivational needs, daily well-being depends on practical emotional and physical needs: rest, food, movement, safety, space, autonomy, clarity, support, affection, respect, play, privacy, belonging, reassurance, expression, and recovery.

EXPAND THE LENS

People often misread unmet basic needs as character problems. Irritability may be exhaustion. Withdrawal may be overstimulation. Indecision may be lack of clarity. Not every inner struggle requires deep interpretation.

HOW IT MAY LOOK IN REAL LIFE

- You think you are “unmotivated” but you are depleted.
- You become reactive after days without privacy or rest.
- You seek reassurance when what you actually need is clarity.

CHECK IN

What basic need might make the biggest difference today?

PRACTICE

Choose one need that can be addressed within 24 hours and meet it in the simplest available way.

GO DEEPER WITH DPNR

Always check for basic-state explanations before interpreting behavior through deeper psychological frameworks.

Competing Needs

UNDERSTAND

Two valid needs can pull in opposite directions. You may want closeness and freedom, security and growth, recognition and privacy, stability and adventure.

EXPAND THE LENS

Conflict does not always mean confusion. Sometimes the person is accurately sensing two truths at once. Good decisions often involve choosing which need leads now and how to care for the other need too.

HOW IT MAY LOOK IN REAL LIFE

- You want commitment and also fear losing independence.
- You want to leave a job and also need financial stability.
- You want to be seen and also want privacy.

CHECK IN

Which two needs are competing in this situation?

PRACTICE

Name both needs without forcing a winner. Then ask: “What choice honors one while reducing unnecessary harm to the other?”

GO DEEPER WITH DPNR

Help the user move from either/or thinking toward sequencing, tradeoffs, and creative integration.

5. VALUES - What Matters & How We Choose

Values help users understand the principles and qualities they want to live by. The system should distinguish values from goals, rules, preferences, and inherited expectations.

Values

UNDERSTAND

Values are qualities or principles you want to embody in how you live - such as honesty, freedom, family, courage, loyalty, creativity, stability, learning, compassion, faith, excellence, adventure, justice, intimacy, contribution, beauty, independence, or belonging.

EXPAND THE LENS

Values are directions, not finish lines. A goal can be completed; a value keeps guiding choices. “Get promoted” is a goal. Achievement, contribution, freedom, mastery, or security may be the values underneath it.

HOW IT MAY LOOK IN REAL LIFE

- Two people may want the same goal for different values.
- A conflict can feel intense because a value - not only a preference - is being threatened.
- A life can look successful while feeling wrong if it repeatedly violates core values.

CHECK IN

What value are you trying to protect or express in this situation?

PRACTICE

Pick five values from a broad list, then reduce to three by asking: “If I could keep only one of these in a difficult season, which one would still guide me?”

GO DEEPER WITH DPNR

Help identify lived values versus admired values and compare them with actual behavior.

Values vs. Rules

UNDERSTAND

A value is a chosen direction. A rule is a fixed statement about how things must be done. Rules can express values, but they can also become rigid or inherited.

EXPAND THE LENS

“Family matters to me” is a value. “A good parent must always put the children first” is a rule. The rule may or may not serve the deeper value in every situation.

HOW IT MAY LOOK IN REAL LIFE

- You feel guilty breaking a rule even when the rule no longer fits your life.
- You judge yourself by “shoulds” you never consciously chose.
- You mistake cultural expectations for personal values.

CHECK IN

Is this truly one of your values - or a rule you learned?

PRACTICE

Take one “I should” sentence and ask: “What value is this rule trying to serve? Is there another way to serve it?”

GO DEEPER WITH DPNR

Explore inherited rules from family, culture, gender, religion, work, and past relationships without dismissing them automatically.

Value Conflicts

UNDERSTAND

Values can conflict. Honesty can conflict with harmony. Freedom can conflict with stability. Loyalty can conflict with self-respect. Achievement can conflict with presence.

EXPAND THE LENS

A difficult decision may not have a value-free solution. Clarity comes from naming the tradeoff rather than pretending one option has no cost.

HOW IT MAY LOOK IN REAL LIFE

- You want to tell the truth but fear hurting someone.
- You want career growth but also want more family presence.
- You value loyalty but a relationship repeatedly violates your standards.

CHECK IN

Which values are in conflict here?

PRACTICE

Write the two competing values. For each option, note which value it honors and which value it costs.

GO DEEPER WITH DPNR

Help the user choose consciously and reduce false guilt by making tradeoffs explicit.

6. LOVE - Attachment, Connection & Relationship Patterns

Teach relationship dynamics as lenses, not labels. Attachment patterns are tendencies that can change across relationships and over time.

Attachment Styles - Overview

UNDERSTAND

Attachment describes patterns in how people seek closeness, respond to distance, handle dependence, and protect themselves in relationships. Common adult patterns are secure, anxious, avoidant, and fearful-avoidant/disorganized.

EXPAND THE LENS

SECURE: comfortable with closeness and autonomy. ANXIOUS: heightened sensitivity to distance or rejection, often seeking reassurance. AVOIDANT: protects independence, may minimize needs or pull away under emotional pressure. FEARFUL-AVOIDANT: may strongly desire closeness while also fearing it, creating push-pull patterns. These are tendencies, not diagnoses or identities.

HOW IT MAY LOOK IN REAL LIFE

- A person may feel secure with friends and anxious in romance.
- Someone avoidant may care deeply but experience closeness as pressure.
- An anxious person may interpret ambiguity as rejection faster than others.

CHECK IN

What happens inside you when someone important becomes less available?

PRACTICE

Notice your first move under relational stress: move closer, pull away, freeze, test, explain, reassure, attack, or self-silence.

GO DEEPER WITH DPNR

Use attachment language carefully. Describe observable patterns before naming a style, and avoid treating style as destiny.

Anxious Attachment Pattern

UNDERSTAND

An anxious attachment pattern often involves heightened attention to signs of distance, uncertainty, rejection, or changing availability. The nervous system may seek reassurance quickly.

EXPAND THE LENS

The need for connection is not the problem. The difficulty is when ambiguity becomes intolerable and behavior becomes organized around restoring certainty at any cost.

HOW IT MAY LOOK IN REAL LIFE

- You reread messages to detect a change in tone.

- A delayed response creates a strong urge to seek reassurance.
- You over-focus on the relationship when you feel insecure.

CHECK IN

What does distance immediately make you fear?

PRACTICE

Before seeking reassurance, name the feared story and one alternative explanation. Then decide whether direct communication is still needed.

GO DEEPER WITH DPNR

Explore reassurance-seeking, fear of abandonment, protest behavior, and self-soothing without shaming the need for closeness.

Avoidant Attachment Pattern

UNDERSTAND

An avoidant pattern often protects autonomy by minimizing needs, reducing emotional dependence, or pulling away when closeness feels demanding, exposing, or hard to regulate.

EXPAND THE LENS

Avoidance can be confused with lack of feeling. Sometimes the person feels deeply but experiences dependence, vulnerability, or expectation as threatening to freedom or control.

HOW IT MAY LOOK IN REAL LIFE

- You feel relief after creating distance, then miss the person later.
- You become highly practical when someone wants emotional closeness.
- You focus on a partner's flaws when intimacy increases.

CHECK IN

What does closeness make you fear you might lose?

PRACTICE

When you want to pull away, name the boundary or need directly before disappearing or shutting down.

GO DEEPER WITH DPNR

Explore autonomy, vulnerability, emotional deactivation, fear of engulfment, and learned self-reliance without pathologizing independence.

Fearful-Avoidant / Push-Pull Pattern

UNDERSTAND

This pattern can involve both longing for closeness and fearing it. The person may move toward connection, then pull away when it becomes real, intense, or vulnerable.

EXPAND THE LENS

The push-pull cycle often makes both people feel confused. The key is to identify what changes at the moment closeness shifts from desired to threatening.

HOW IT MAY LOOK IN REAL LIFE

- You intensely miss someone when they are distant but feel trapped when they come closer.
- You test a relationship, then distrust the reassurance you receive.
- You alternate between idealizing connection and needing escape.

CHECK IN

At what point does closeness begin to feel unsafe?

PRACTICE

Draw the cycle: longing -> closeness -> trigger -> protection -> distance -> longing. Mark where you have the most choice.

GO DEEPER WITH DPNR

Help the user see the cycle without assigning blame or using attachment style as a fixed identity.

Secure Relating

UNDERSTAND

Secure relating is the capacity to stay connected to yourself while staying connected to others. It includes clear communication, boundaries, repair, flexibility, trust, and tolerance for temporary distance or disagreement.

EXPAND THE LENS

Security does not mean never feeling jealous, anxious, hurt, or triggered. It means those states do not consistently control the relationship.

HOW IT MAY LOOK IN REAL LIFE

- You can ask for reassurance without demanding certainty.
- You can disagree without threatening the bond.
- You can say no without withdrawing love.

CHECK IN

What would a secure response look like in this situation?

PRACTICE

Choose one secure behavior: ask directly, name a need, set a boundary, tolerate a pause, or repair after conflict.

GO DEEPER WITH DPNR

Use secure relating as a behavior set, not a personality label.

Relationship Red Flags vs. Triggers

UNDERSTAND

A trigger is an internal activation. A red flag is observable behavior that may indicate incompatibility, disrespect, manipulation, unreliability, coercion, or harm. Being triggered does not automatically mean the relationship is unsafe, and feeling calm does not automatically mean it is healthy.

EXPAND THE LENS

Look at patterns, not isolated moments: consistency, accountability, respect for boundaries, honesty, reciprocity, emotional safety, and repair.

HOW IT MAY LOOK IN REAL LIFE

- A delayed message may trigger abandonment fear but is not automatically a red flag.
- Repeated lying is a behavioral pattern, not merely a trigger.
- Feeling intense chemistry does not prove compatibility.

CHECK IN

What is the observable behavior - separate from what it makes you feel?

PRACTICE

Describe the situation using only facts a camera could record. Then separately list your interpretations and emotions.

GO DEEPER WITH DPNR

Help distinguish internal activation from external behavior and avoid minimizing genuinely harmful patterns.

7. BOUNDARIES & COMMUNICATION - Staying Connected Without Losing Yourself

These topics turn emotional insight into relational clarity.

Boundaries

UNDERSTAND

Boundaries are limits that help you stay connected to yourself while interacting with others. They clarify what is okay, what is not, what you are available for, and what you need.

EXPAND THE LENS

Boundaries can be external (“I will leave if I am shouted at”) or internal (“I will not keep explaining after I have answered clearly”). They are not punishments and they do not control another person's choices.

HOW IT MAY LOOK IN REAL LIFE

- You say yes and feel resentment later.
- You feel responsible for preventing someone else's disappointment.
- You keep participating in a conversation after you are emotionally flooded.

CHECK IN

What are you allowing that is costing you self-respect or peace?

PRACTICE

Complete: “When X happens, I will Y because I need Z.”

GO DEEPER WITH DPNR

Help distinguish boundary, request, preference, threat, and attempt to control another person.

Boundary vs. Ultimatum

UNDERSTAND

A boundary describes what you will do to protect your well-being. An ultimatum tries to force another person to behave a certain way, often through threat or pressure.

EXPAND THE LENS

“If you shout at me, I will end the conversation” is a boundary. “You are not allowed to be angry” is control. Sometimes serious situations do require clear consequences, but the focus remains on your action.

HOW IT MAY LOOK IN REAL LIFE

- You repeat a boundary but never follow through.
- You call something a boundary while trying to manage another person's choices.
- You are afraid that any limit is “mean.”

CHECK IN

Is this about what you will do - or what you need them to do?

PRACTICE

Rewrite one boundary so it contains your action, not a command for the other person.

GO DEEPER WITH DPNR

Clarify enforceable boundaries and realistic consequences.

Assertiveness

UNDERSTAND

Assertiveness is expressing your needs, opinions, feelings, and limits clearly while respecting the other person's right to have their own perspective.

EXPAND THE LENS

It sits between passivity and aggression. Assertiveness does not guarantee agreement; it makes your position visible.

HOW IT MAY LOOK IN REAL LIFE

- You over-explain to make your request impossible to reject.
- You avoid asking until resentment builds.
- You become harsh because being direct feels vulnerable.

CHECK IN

What would the clearest respectful sentence be?

PRACTICE

Use: "When __ happens, I feel __. I need / prefer __. Are you willing to __?"

GO DEEPER WITH DPNR

Help the user shorten communication, reduce mind-reading, and tolerate the possibility of a no.

Conflict & Repair

UNDERSTAND

Conflict is disagreement or friction. Repair is what happens afterward to restore understanding, accountability, trust, or connection. Healthy relationships are not conflict-free; they are repair-capable.

EXPAND THE LENS

Repair can include apology, clarification, validation, changed behavior, boundary-setting, or accepting that not every disagreement will fully resolve.

HOW IT MAY LOOK IN REAL LIFE

- You focus on proving who was right instead of understanding impact.

- An apology happens but behavior never changes.
- You avoid conflict so nothing ever gets repaired.

CHECK IN

What would repair require beyond explanation?

PRACTICE

Complete three lines: “My part was... The impact may have been... Next time I want to...”

GO DEEPER WITH DPNR

Help distinguish explanation, accountability, forgiveness, and actual behavioral repair.

8. BODY - Nervous System, Somatic Signals & Energy

The body is treated as a source of information, not as infallible truth. Sensations can reflect stress, excitement, memory, fatigue, illness, or context.

Body Signals

UNDERSTAND

The body often registers activation before conscious thought catches up. Tightness, heat, heaviness, restlessness, numbness, shallow breathing, or expansion can offer clues about state.

EXPAND THE LENS

Body sensations are data, not verdicts. A racing heart can mean anxiety, excitement, caffeine, illness, or exertion. Interpretation should stay curious and contextual.

HOW IT MAY LOOK IN REAL LIFE

- Your shoulders tense before you admit you are overwhelmed.
- You feel relief in your body after saying no.
- You mistake activation for certainty about what a situation means.

CHECK IN

What is your body doing right now, before you explain why?

PRACTICE

Name three neutral sensations without interpretation: pressure, warmth, tightness, movement, numbness, etc.

GO DEEPER WITH DPNR

Use somatic awareness to support regulation and decision-making without overclaiming meaning.

Fight, Flight, Freeze & Fawn

UNDERSTAND

Under threat or strong stress, the nervous system may mobilize toward fighting, escaping, freezing, or appeasing. These are protective responses, not moral failures.

EXPAND THE LENS

FIGHT may look like anger or control. FLIGHT like urgency, escape, overworking, or restlessness. FREEZE like shutdown, numbness, indecision, or going blank. FAWN like appeasing, agreeing, or abandoning your needs to preserve safety.

HOW IT MAY LOOK IN REAL LIFE

- You cannot think during conflict and later remember what you wanted to say.
- You become unusually agreeable when someone is upset with you.
- You need to leave immediately when tension rises.

CHECK IN

Which protective response shows up first when you feel threatened?

PRACTICE

Identify the state, then choose one regulating action before making a major decision.

GO DEEPER WITH DPNR

Normalize protective responses while helping the user regain choice and avoid using these labels as fixed personality types.

Window of Tolerance

UNDERSTAND

The window of tolerance is the range in which you can feel emotion while still thinking, communicating, and choosing. Above it, you may become hyperactivated. Below it, you may shut down or disconnect.

EXPAND THE LENS

The goal is not to remain perfectly calm. It is to notice when you have moved outside your workable range and return before attempting complex reflection or conflict resolution.

HOW IT MAY LOOK IN REAL LIFE

- You keep arguing even though neither person can think clearly.
- You feel numb and assume that means you no longer care.
- You try to solve a problem while highly activated.

CHECK IN

Are you regulated enough to think clearly right now?

PRACTICE

Rate activation from 0-10. If above 7 or below 3, regulate first and revisit the issue later.

GO DEEPER WITH DPNR

Prioritize state regulation before insight when the user is flooded, shut down, or highly activated.

Rest, Recovery & Depletion

UNDERSTAND

Rest is not only sleep. Recovery can include quiet, play, nature, reduced decision load, movement, social connection, solitude, food, creativity, or time without performance.

EXPAND THE LENS

Depletion can distort interpretation. Before assigning deep meaning to irritability, hopelessness, or disconnection, check basic state factors.

HOW IT MAY LOOK IN REAL LIFE

- Everything feels more personal when you are exhausted.
- You call yourself lazy when you are actually depleted.
- You rest physically but never mentally disconnect.

CHECK IN

What kind of recovery are you missing?

PRACTICE

Choose one form of recovery your body or mind has not received recently and schedule a small version of it.

GO DEEPER WITH DPNR

Check sleep, food, physical health, workload, stimulation, and recovery before psychologizing every state.

9. DECISIONS & DIRECTION - Choice Under Uncertainty

These topics help users move from emotional noise to clearer decisions without pretending certainty is always available.

Decision-Making

UNDERSTAND

A good decision is not the same as a guaranteed outcome. Good decisions use the best available information, relevant values, needs, risks, and constraints at the time.

EXPAND THE LENS

People often delay decisions because they want certainty about the future. Sometimes clarity comes before action; sometimes clarity grows through action.

HOW IT MAY LOOK IN REAL LIFE

- You keep revisiting a decision after no new information has arrived.
- You ask for advice until you hear the answer you want.
- You confuse anxiety with evidence that the choice is wrong.

CHECK IN

What do you know, what do you not know, and what cannot be known yet?

PRACTICE

Make three columns: facts, assumptions, unknowns. Decide only from the first two while respecting the third.

GO DEEPER WITH DPNR

Help separate decision quality from outcome quality and identify whether the user needs more data or more tolerance for uncertainty.

Fear vs. Desire in Decisions

UNDERSTAND

Many decisions contain both desire and fear. The question is not “Which one is real?” but “Which one should lead?”

EXPAND THE LENS

Fear can provide useful risk information. Desire can provide direction. A mature decision listens to both without allowing either to dominate automatically.

HOW IT MAY LOOK IN REAL LIFE

- You want to apply for a role but fear rejection.
- You want to leave a relationship but fear loneliness.
- You want closeness but fear losing freedom.

CHECK IN

If fear were not making the decision, what would you want? If desire ignored all risk, what would it miss?

PRACTICE

Write one sentence from fear and one from desire. Then write a third from your wiser decision-making self.

GO DEEPER WITH DPNR

Integrate risk, values, needs, and long-term consequences rather than treating fear as the enemy.

Future Self

UNDERSTAND

The future-self lens helps users make choices based on the person they are becoming, not only the discomfort of the present moment.

EXPAND THE LENS

It should not become fantasy or self-pressure. The useful future self is realistic, value-aligned, and connected to small present actions.

HOW IT MAY LOOK IN REAL LIFE

- You know what you want long term but repeatedly choose short-term relief.
- You imagine a future identity but do not change current routines.
- You postpone life until you become “better.”

CHECK IN

What would your future self thank you for doing now?

PRACTICE

Choose one action that takes less than 15 minutes and is consistent with the future you want.

GO DEEPER WITH DPNR

Keep future-self work concrete and avoid using idealized identity as another perfectionistic standard.

10. CREATE - Work, Money, Ambition & Expression

These topics connect inner patterns to professional life without reducing business challenges to psychology alone.

Ambition

UNDERSTAND

Ambition is the drive to build, achieve, influence, master, create, or expand. It can be healthy, joyful, compensatory, fear-driven, or some combination.

EXPAND THE LENS

The question is not whether ambition is good or bad, but what it serves and what it costs. Achievement can express values or become a way to regulate worth.

HOW IT MAY LOOK IN REAL LIFE

- You feel alive while creating but empty after recognition fades.
- You cannot slow down without feeling guilty.
- You keep raising the goal because reaching it does not create enough.

CHECK IN

What does achievement give you emotionally?

PRACTICE

Name the goal, then name the feeling or need you expect it to create. Ask whether that need has other sources too.

GO DEEPER WITH DPNR

Explore purpose, significance, security, creativity, comparison, and self-worth without assuming ambition is compensation.

Money Meaning

UNDERSTAND

Money is practical, but it also carries emotional meaning: safety, freedom, status, power, care, possibility, success, control, generosity, or fear.

EXPAND THE LENS

People can have conflicting money stories learned from family, culture, scarcity, privilege, or past experiences. Understanding meaning can improve choices without replacing financial facts.

HOW IT MAY LOOK IN REAL LIFE

- Spending creates guilt even when you can afford it.
- Saving creates safety far beyond the actual numbers.
- Income becomes a measure of personal success.

CHECK IN

What does money represent emotionally for you?

PRACTICE

Finish: “More money would mean... Less money would mean...” Look for the emotional words underneath.

GO DEEPER WITH DPNR

Keep emotional reflection separate from financial advice; encourage concrete numbers when decisions require them.

Creative Block

UNDERSTAND

A creative block is difficulty accessing ideas, expression, or momentum. It can come from fear of judgment, perfectionism, depletion, ambiguity, boredom, or lack of input.

EXPAND THE LENS

Creativity often needs alternation between focus and openness. More pressure is not always the solution.

HOW IT MAY LOOK IN REAL LIFE

- You edit before you have created anything.
- You compare your early draft to someone else's finished work.
- You call yourself uninspired after weeks without recovery or novelty.

CHECK IN

What is stopping the first imperfect version from existing?

PRACTICE

Create a deliberately rough version for ten minutes with no editing allowed.

GO DEEPER WITH DPNR

Identify whether the block is emotional, structural, energetic, or informational.

Success & Enough

UNDERSTAND

Success is an outcome or condition you define. “Enough” is the point at which more is no longer automatically better. Without an internal definition, success can become endlessly moving.

EXPAND THE LENS

Enough can apply to money, recognition, workload, growth, possessions, visibility, or achievement. It does not mean lack of ambition; it creates a reference point.

HOW IT MAY LOOK IN REAL LIFE

- Every milestone immediately becomes the starting line for the next one.
- You cannot enjoy progress because the target keeps moving.
- You do not know what would actually feel sufficient.

CHECK IN

What would “enough for this season” look like?

PRACTICE

Define one concrete enough-point for money, work hours, or achievement this month.

GO DEEPER WITH DPNR

Help the user distinguish chosen ambition from compulsive escalation.

11. REPAIR - Inner Child, Beliefs, Forgiveness & Old Learning

These topics help users understand the influence of past learning without turning every present difficulty into a childhood explanation.

Inner Child - A Practical Lens

UNDERSTAND

“Inner child” is a metaphor for younger emotional learning that can still shape present reactions - especially around safety, love, approval, shame, play, and belonging.

EXPAND THE LENS

The concept is useful when it creates compassion and choice. It becomes unhelpful if every adult reaction is attributed to childhood or if it removes responsibility for present behavior.

HOW IT MAY LOOK IN REAL LIFE

- Criticism makes you feel suddenly small or powerless.
- You become intensely afraid of disappointing authority figures.
- Play, tenderness, or creativity feel inaccessible.

CHECK IN

Does this reaction feel connected to an older emotional memory or role?

PRACTICE

Ask: “What did younger me need then? What can adult me provide now?” Choose one realistic action.

GO DEEPER WITH DPNR

Use childhood links as hypotheses and return agency to the present-day adult self.

Limiting Beliefs

UNDERSTAND

A limiting belief is a conclusion about yourself, others, or life that narrows what you consider possible. Examples: “I am too much,” “People always leave,” “Success requires sacrifice,” “I cannot trust myself.”

EXPAND THE LENS

Beliefs are not changed by positive slogans alone. They weaken when they are examined, updated with evidence, and replaced with more accurate working beliefs.

HOW IT MAY LOOK IN REAL LIFE

- You reject opportunities before testing them.
- You interpret neutral events through the same negative conclusion.
- You keep choosing situations that confirm what you already believe.

CHECK IN

What belief is this situation activating?

PRACTICE

Write the belief. Then list evidence for it, evidence against it, and a more accurate middle statement.

GO DEEPER WITH DPNR

Focus on accuracy rather than forced positivity.

Forgiveness

UNDERSTAND

Forgiveness is a personal process of reducing the hold of resentment, revenge, or unresolved grievance. It is not forgetting, excusing, reconciling, or removing boundaries.

EXPAND THE LENS

Some people choose forgiveness; others first need distance, accountability, grief, or safety. The concept should never be used to pressure someone back into harmful contact.

HOW IT MAY LOOK IN REAL LIFE

- You think forgiving means saying what happened was okay.
- You stay angry because anger feels like the only protection left.
- You forgive verbally but continue to violate your own boundary.

CHECK IN

What would forgiveness mean to you - and what are you afraid it would require?

PRACTICE

Separate four things: understanding, accountability, forgiveness, reconciliation. Decide which, if any, is appropriate now.

GO DEEPER WITH DPNR

Never equate forgiveness with reunion or access.

Self-Compassion

UNDERSTAND

Self-compassion is responding to your own pain, mistakes, or limitation with the same humanity you would offer someone you care about. It is not self-indulgence or avoiding responsibility.

EXPAND THE LENS

Compassion and standards can coexist. Harshness is not the only path to growth.

HOW IT MAY LOOK IN REAL LIFE

- You believe you need self-criticism to stay motivated.

- You recover slowly because mistakes become identity judgments.
- You can understand everyone's context except your own.

CHECK IN

What would accountability sound like without cruelty?

PRACTICE

Write what happened as if speaking to a good friend who still needs to take responsibility.

GO DEEPER WITH DPNR

Help the user combine responsibility, learning, and humane self-talk.

12. LIFE - Meaning, Joy, Gratitude & Integration

These topics widen attention beyond fixing problems and support a fuller relationship with life.

Meaning vs. Happiness

UNDERSTAND

Happiness is a positive emotional experience. Meaning is the sense that life, actions, relationships, or effort connect to something that matters. They overlap, but they are not identical.

EXPAND THE LENS

A meaningful life can include grief, difficulty, sacrifice, and uncertainty. A pleasant life can still feel empty if it lacks connection, purpose, or alignment.

HOW IT MAY LOOK IN REAL LIFE

- You are doing well but feel flat.
- A difficult responsibility still feels deeply worthwhile.
- You chase positive feelings but remain disconnected from what matters.

CHECK IN

What feels worth doing even when it is not easy?

PRACTICE

Name one activity that gives pleasure and one that gives meaning. Make room for both this week.

GO DEEPER WITH DPNR

Help the user avoid treating happiness as a permanent emotional state.

Gratitude

UNDERSTAND

Gratitude is deliberate attention to what is supportive, meaningful, beautiful, or already present. It does not require denying pain or pretending everything is good.

EXPAND THE LENS

Healthy gratitude expands attention. Toxic positivity uses gratitude to suppress legitimate distress. Both can sound similar on the surface, so context matters.

HOW IT MAY LOOK IN REAL LIFE

- You notice what is missing faster than what is working.
- You feel guilty for being unhappy because “you should be grateful.”
- Small positive moments disappear quickly from attention.

CHECK IN

What is present today that you do not want to take for granted?

PRACTICE

Name three specific things from the last 24 hours and why each mattered.

GO DEEPER WITH DPNR

Use gratitude alongside, not instead of, emotional truth.

Joy & Play

UNDERSTAND

Joy and play are not rewards for finishing all responsibilities. They are forms of aliveness, regulation, creativity, connection, and recovery.

EXPAND THE LENS

Adults often narrow play into entertainment or achievement. Play can include music, movement, humor, curiosity, games, art, nature, spontaneity, or doing something with no productive outcome.

HOW IT MAY LOOK IN REAL LIFE

- You cannot remember the last thing you did with no purpose.
- Fun feels irresponsible when work is unfinished.
- You consume entertainment but rarely feel genuinely playful.

CHECK IN

What feels fun before it becomes useful?

PRACTICE

Do one ten-minute activity with no improvement goal and no output requirement.

GO DEEPER WITH DPNR

Help distinguish passive distraction from active restoration and play.

Purpose

UNDERSTAND

Purpose is a sense of direction or contribution that gives coherence to choices. It can be large or local, stable or evolving. Not everyone needs one grand life mission.

EXPAND THE LENS

Purpose often emerges through values, strengths, relationships, responsibility, curiosity, and repeated action - not only through revelation.

HOW IT MAY LOOK IN REAL LIFE

- You keep waiting to discover “the one thing” you were meant to do.
- Your work is meaningful but not your entire purpose.
- A life transition changes what feels important.

CHECK IN

What do you want your energy to serve in this season?

PRACTICE

Write one sentence: “Right now, I want to use my time and abilities to...” Keep it provisional.

GO DEEPER WITH DPNR

Protect users from purpose pressure; allow multiple sources of meaning.

Integration

UNDERSTAND

Integration is the process of turning insight into lived change. Understanding a pattern is useful, but the nervous system and daily life learn through repetition, environment, relationships, and behavior.

EXPAND THE LENS

Insight without action can become another form of avoidance. Action without reflection can repeat old patterns. Integration connects both.

HOW IT MAY LOOK IN REAL LIFE

- You can explain your pattern perfectly but still repeat it.
- You have many tools but use none when activated.
- You make a major insight and expect immediate permanent change.

CHECK IN

What would this insight look like as one behavior?

PRACTICE

Choose one cue and one response: “When X happens, I will practice Y.” Keep it small enough to repeat.

GO DEEPER WITH DPNR

Always end deeper reflection with a realistic integration step when the user is ready.

APPENDIX A - Core Topic Map

Suggested starter taxonomy for tagging and retrieval.

SELF: Identity, Self-worth, Self-trust, Authenticity, Inner critic

FEEL: Emotion vs reaction, Triggers, Regulation, Anger, Shame vs guilt, Grief

PATTERNS: Avoidance, People-pleasing, Perfectionism, Control, Rumination, Procrastination

NEEDS: Needs vs neediness, Six broad needs, Basic needs, Competing needs

VALUES: Values, Values vs rules, Value conflicts

LOVE: Attachment overview, Anxious, Avoidant, Fearful-avoidant, Secure relating, Red flags vs triggers

BOUNDARIES: Boundaries, Boundary vs ultimatum, Assertiveness, Conflict & repair

BODY: Body signals, Fight/flight/freeze/fawn, Window of tolerance, Rest & recovery

NEXT: Decision-making, Fear vs desire, Future self

CREATE: Ambition, Money meaning, Creative block, Success & enough

REPAIR: Inner child, Limiting beliefs, Forgiveness, Self-compassion

LIFE: Meaning vs happiness, Gratitude, Joy & play, Purpose, Integration

APPENDIX B - Model Metadata

Recommended invisible metadata for personalization and routing.

Life Domain: Relationships / Family / Work / Career / Finance / Health / Personal Growth / Emotional Well-being / Spirituality / Leisure

Core Lens: Value / Need / Boundary / Emotion / Belief / Pattern / Behavior / Body / Identity / Decision

Depth: Light / Everyday / Reflective / Deep

Mode: Learn / Notice / Reflect / Practice / Choose / Integrate

State: Grounded / Activated / Shut Down / Curious / Conflicted / Motivated / Depleted

Route: Library / Main Chat / Journal / Mirror Room / Decision Room / Growth Tracker

Confidence Rule: Personalize only when there is enough evidence. Use phrases such as “This may be relevant” or “A pattern I notice is...” rather than presenting inference as fact.

APPENDIX C - Generation Rules for Future Library Topics

Use these rules when expanding the library.

1. One concept per unit. Keep the user-facing lesson readable in 2-4 minutes.
2. Teach before interpreting. Never assume the user knows psychological terminology.
3. Include useful distinctions (for example: need vs neediness, guilt vs shame, boundary vs ultimatum, emotion vs reaction).
4. Give 3-5 everyday examples across different life domains.
5. Ask only one core check-in question in the base unit.
6. Give one practical exercise that can be completed immediately or within 24 hours.
7. Deepening should be personalized from known context and should not repeat the generic lesson.
8. Use psychological models as lenses, not identities or diagnoses.
9. Do not attribute every pattern to childhood, trauma, attachment, or the nervous system.
10. Always preserve agency: understanding a pattern should increase choice, not excuse harmful behavior.

MASTER USE NOTE

This document is intended to be used as one source of truth for the DPNR Library MVP: Part I defines how content is organized, discovered, tagged, personalized, and routed; Part II provides the actual starter teaching content. Do not treat the category order as a rigid user journey. The user-facing experience should remain dynamic, contextual, and personalized.
